6 Fundamentals of Turbo Codes $L_c(x)$, is measured by forming the logarithm of the ratio of the values of \hat{a}_1 and \hat{a}_2 for a particular observation of x (see Figure 1), which appears as the second term in

consequent explosion of research into all aspects of turbo codes. This paper examines the principles of turbo coding and decoding, focussing on the coding and decoding algorithms. It then examines the performance of turbo codes, both in multilevel and simple constellations. It concludes by examining the state of turbo code research and development.

gain of our proposed codes over the LTE Turbo codes. \hat{a}_1 We evaluate the TBER performance of our proposed IC Turbo codes through intensive Monte Carlo simulations. Simulation results demonstrate that our proposed codes have a SNR gain ranges from 0.26 dB to 0.72 dB compared to the LTE Turbo codes for various code parameters at a TBER level of 10^{-2} .

Decoding details of turbo codes are out of the scope of this paper. An interested reader is one is referred to [13] [14] and [17] for further details. Performance evaluation Lots of research were carried out to find bounds on the performance on turbo codes [2][3][10], but the inherent complexity of the code prevented general and tight results.
