Histone methylation is a process by which methyl groups are transferred to amino acids of histone proteins that make up nucleosomes, which the DNA double helix wraps around to form chromosomes. Methylation of histones can either increase or decrease transcription of genes, depending on which amino acids in the

histones are methylated, and how many methyl groups are attached.

What do food cravings mean? Some nutritionists and healthcare providers believe that certain cravings are meaningful. For example, some experts think that craving large amounts of ice and nonfood substances, such as laundry starch and dirt or clay (a condition called pica), are linked to an iron or zinc deficiency, though there's not enough research to support a cause and effect relationship.
