The memory cell is the fundamental building block of computer memory. The memory cell is an electronic circuit that stores one bit of binary information and it must be set to store a logic 1 (high voltage level) and reset to store a logic 0 (low voltage level). Its value is maintained/stored until it is changed by the set/reset process.

Random-access memory - Wikipedia

Memory ordering describes the order of accesses to computer memory by a CPU. The term can refer either to the memory ordering generated by the compiler during compile time, or to the memory ordering generated by a CPU during runtime. In modern microprocessors, memory ordering characterizes the CPUs ability to reorder memory operations - it is a type of out-of-order execution.

Use this document with the External Memory Interfaces chapter of the relevant device family handbook. Typically, all external memory interfaces require the following FPGA resources: After you know the requirements for your external memory interface, you can start planning your system. The I/O pins and internal memory cannot be shared for other applications or external memory interfaces.
