In fluid mechanics, multiphase flow is simultaneous flow of (a) materials with different states or phases (i.e. gas, liquid or solid), or (b) materials with different chemical properties but in the same state or phase (i.e. liquid-liquid systems such as oil droplets in water).. Each of the phases is considered to have a separately defined volume fraction (the sum of which is unity) and ...

Superficial velocity (or superficial flow velocity), in engineering of multiphase flows and flows in porous media, is a hypothetical (artificial) flow velocity calculated as if the given phase or fluid were the only one flowing or present in a given cross sectional area. Other phases, particles, the skeleton of the porous medium, etc. present in the channel are disregarded.

Analyzing and modelling liquid-liquid two-phase flow has previously been explored by many researchers as well as present authors (Raj et al., 2005, Chakrabarti et al., 2006, Chakrabarti et al., 2007). Deposition in two-phase flow shows some characteristics similar to liquid-liquid two-phase flow.
