Optical Coatings and Materials OPTICAL COATINGS A6 Optical Coatings 1-505-298-2550 OPTICAL COATINGS The vast majority of optical components are made of various types of glass, and most are coated with thin layers of special materials. The purpose of these coatings is to modify the reflection and transmission properties of the components's surfaces.

Deposition technology has evolved tremendously since the first single layer optical interference coating was presented more than 70 years ago. Today, methods involving evaporation deposition, IBS, and APRS are amongst the preferred technologies for thin film production.

Optical interference coatings use the principle of interference to produce a variety of spectral profiles. A fundamental aspect of interference is the phase change on traversal of the film.

An Introduction to Optical Coatings An optical coating is composed of a combination of thin film layers that create interference effects used to enhance transmission or reflection properties within an optical system.

An Introduction to Optical Coatings | Edmund Optics

Interference coatings are an essential part of modern optics. This book is designed to give a concise but complete overview of the field, with contributions written by leading experts in the various areas.

Optical Interference Coatings | SpringerLink

• State the conditions required for producing interference patterns. • Define constructive and destructive interference. • Describe a laboratory setup to produce a double-slit interference pattern. • State the conditions for an automatic phase shift of 180° at an interface between two optical media.

Magnesium fluoride is probably the most widely used thin film material for optical coatings. Its performance is not outstanding but represents a significant improvement over an uncoated surface because its index is too high to provide a good impedance match at the air-glass interface.
